

HybridCache in .NET 9

HybridCache utilizes the cache-aside pattern to load data on demand into the cache from a data store.

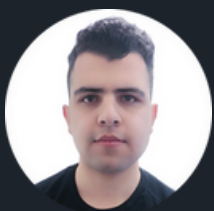

```
public class ArticleService(HybridCache hybridCache) : IArticleService
{
    private const string CacheKey = "articles";

    public async Task<List<Article>> GetArticles(
        CancellationToken cancellationToken)
    {
        var articles =
            await hybridCache.GetOrCreateAsync(
                CacheKey,
                async cancel => await GetValuesFromDbAsync(cancel),
                token: cancellationToken);

        return articles;
    }
}

builder.Services.AddHybridCache(options =>
{
    options.MaximumPayloadBytes = 1024 * 1024;
    options.MaximumKeyLength = 1024;

    options.DefaultEntryOptions = new HybridCacheEntryOptions()
    {
        Expiration = TimeSpan.FromMinutes(10),
        LocalCacheExpiration = TimeSpan.FromMinutes(10)
    };
});
```

HybridCache – Continued

Microsoft.Extensions.Caching.Hybrid is currently in pre-release mode.

```
builder.Services.AddStackExchangeRedisCache(options =>
{
    options.Configuration = "Your_Redis_Connection_String";

    // Optional: Instance name for distinguishing multiple caches
    options.InstanceName = "SampleInstance";
});
```

Redis can be configured as the secondary cache!

```
[Route("api/[controller]")]
[ApiController]
public class ArticleController : ControllerBase
{
    private readonly IArticleService _articleService;

    public ArticleController(IArticleService articleService)
    {
        _articleService = articleService;
    }

    [HttpGet]
    public async Task<ActionResult<List<Article>>> GetArticles(
        CancellationToken cancellationToken)
    {
        var articles = await _articleService.GetArticles(
            cancellationToken);
        return Ok(articles);
    }
}
```
