

IQueryable vs. IEnumerable

IQueryable:

Overview

- It applies the filter directly at the source, and only retrieves the filtered data.

Swip

IQueryable:

Use case

- For large datasets or databases.
- When querying data from remote sources.
- When performance optimization is required.

```
IQueryable<Books> BookList = _db.Books;  
var result = BookList.Where(e => e.Price > 1000).ToList();
```

Swip

IEnumerable:

Overview

- It fetches all data from the source and applies the filter in memory.

Swip

IEnumerable:

Use case

- For in-memory data collections.
- When working with small to medium datasets.
- When the data source is not a database.

```
IEnumerable<Books> BookList = _db.Books;  
var result = BookList.Where(e => e.Price > 1000).ToList();
```
